Tips on Keeping Culligan Quench Machines Sanitised Between PM Service Calls

- Wipe the entire exterior of the machine with a clean towel using non-abrasive disinfecting household cleaning spray.
- If your Culligan Quench machine has a drip tray, be sure to regularly empty the tray and wipe the interior and grill dry.
- Clean up any water around the base of the machine that may have spilled.

A Culligan Quench technician will perform a preventive maintenance service call yearly for water coolers and coffee brewers and two times a year for ice machines and most sparkling water coolers.

No matter what Culligan Quench machine you have, regular Culligan Quench preventive maintenance service calls ensure that it is operating properly and efficiently to provide fresh, filtered water, ice, and/or coffee.
